Is your *in vivo* research data reproducible?

Reproducibility starts with choosing the right mice. An investigation has shown that 50% of past preclinical research is not reproducible, at a cost of US \$28 billion per year (Freedman et al.). By using the correct animal model, you could

increase reproducibility and avoid the loss of time, resources, and possible funding — not to mention reducing the number of animals used.

What if you could validate/prove your research without buying the first animal model?
